

Pymaceuticals

Analysis of clinical studies of tumor response to medical treatment enabled to see the following trends for the 4 selected treatments (Capomulin, Infubinol, Ketapril, and Placebo):

1. Only Capomulin shows actual tumor decrease. Other medicines demonstrated even faster growth than placebo, which should be evaluated in a more comprehensive study.
2. Regarding metastatic growth, no medicine demonstrated the strength to prevent metastasizing. Even though no-treatment option (using placebo) shows faster appearance of new tumors, overall results are not yet satisfactory.
3. Survival rates again proved Capomulin to be the most effective treatment among the chosen ones. Mice have actually been able to survive the study period being given Capomulin. We can definitely conclude that this treatment could be a potential scientific discovery.
